# The high temperature specialist up to $+250^{\circ}C$ Up to six times more wear-resistant than iglidur<sup>®</sup> X iglidur<sup>®</sup> X6

# 

When to use it?

- When temperatures are higher than +150°C
- When the wear resistance of iglidur® X in pivoting and rotating applications is not sufficient
- When the press-fit should be improved over iglidur<sup>®</sup> X
- When high media resistance is required
- When a bearing which is free of PTFE is required

#### When not to use?

- When a cost-effective universal plain bearing is required iglidur<sup>®</sup> G
- When a plain bearing for underwater use is required iglidur® UW500, iglidur® H370
- When a wear-resistant high-temperature plain bearing for linear motion is required ialidur<sup>®</sup> Z

500 - 000

(1N)

Also available as:

### The high temperature specialist up to +250°C Up to six times more wear-resistant than iglidur<sup>®</sup> X

Due to nanotechnology, iglidur® X6 shows up to six longer service life than iglidur® X in many pivoting and rotating applications - even at temperatures over +100°C.

Bar stock.

Shore D hardness		89	DIN 53505	
Physical and thermal properties				
Max. application temperature long-term	°C	+250		
Max. application temperature short-term	°C	+315		
Min. application temperature	°C	-100		
Thermal conductivity	W/m ⋅ K	0.55	ASTM C 177	BoHS
Coefficient of thermal expansion (at +23°C)	K⁻¹ · 10⁻⁵	1.1	DIN 53752	
Electrical properties <sup>5)</sup>				
Specific contact resistance	Ωcm	< 10 <sup>5</sup>	DIN IEC 93	ISC
Surface resistance	Ω	< 10 <sup>3</sup>	DIN 53482	3547

<sup>5</sup> The good conductivity of this material can favour the generation of corrosion on the metallic contact components.

Table 01: Material properties

With respect to its general mechanical and thermal specifications, iglidur® X6 is directly comparable to our high-temperature classic, iglidur® X, and may even provide advantages, such as its wear behaviour.

#### Moisture absorption

Under standard climatic conditions, the moisture absorption of iglidur® X6 plain bearings is approximately 0.1% weight. The saturation limit in water is 0.5% weight. These values are so low that a moisture expansion need to be considered only in extreme cases.

### Vacuum

In vacuum, any present moisture is released as vapour. The use in vacuum is generally possible.

Resistant to radiation up to an intensity of 2 · 10<sup>5</sup>Gy.

#### Resistance to weathering

iglidur® X6 plain bearings are continuously resistant to weathering. The material properties are only slightly affected. Possible discolorations are only superficial.

iglidur<sup>®</sup> X6

+250°C

150MPa

With increasing temperatures, the compressive strength of iglidur<sup>®</sup> X6 plain bearings decreases. Diagram 02 shows this inverse relationship. The maximum recommended surface pressure is a mechanical material parameter. No conclusions regarding the tribological properties can be drawn from this.

Diagram 03 shows the elastic deformation of iglidur® X6 at radial loads. At the maximum recommended surface pressure of 150MPa the deformation is less than 2%. A possible deformation could be, among others, dependant on the duty cycle of the load.

Surface pressure, page 41

Mechanical properties

Radiation resistance

IQUS

## Bearing technology | Plain bearing | iglidur<sup>®</sup> X6

#### Permissible surface speeds

The high temperature resistance and good thermal conductivity values mean that iglidur® X6 is suitable for high-speed applications. At the given speeds, friction can cause a temperature increase to maximum permissible levels. In practice, though, this level is rarely reached due to varying application conditions. Surface speed, page 44

#### Temperature

The ambient temperatures strongly influence the properties of plain bearings. With regard to temperature resistance, iglidur® X6 is among the highest in the iglidur® range. In many tests it has shown a six times higher wear resistance compared to the established high-temperature specialist iglidur® X. For temperatures over +165°C an additional securing is required.

Application temperatures, page 49 Additional securing, page 49

#### Friction and wear

Similar to wear resistance, the coefficient of friction u also changes with the load. The coefficient of friction of iglidur® X6 declines with higher pressure and is practically constant for pressures above 30MPa. A higher speed of the shaft also results in a lower coefficient of friction (diagram 04 and 05). Coefficient of friction and surfaces, page 47 Wear resistance, page 50

#### Shaft materials

The friction and wear are also dependent, to a large degree, on the shaft material. Shafts that are too smooth, increase both the coefficient of friction and the wear of the bearing. The best case for iglidur® X6 is a ground surface with an average surface finish  $Ra = 0.4 - 0.7 \mu m$ . Diagram 06 shows the test results of iglidur® X6 plain bearings running against various shaft materials. The best performance is achieved with the plain shaft materials free cutting steel and plain steel 1.0037. At higher loads, we recommend harder steel qualities. Non-hardened steel shafts can be worn by the bearing at pressures over 2MPa. The wear database shows that iglidur® X6 is more suitable for rotating than for pivoting applications (diagram 07). If the shaft material you plan on using is not shown in these test results, please contact us.

Shaft materials, page 52

302

#### Installation tolerances

iglidur® X6 plain bearings are standard bearings for shafts with h tolerance (recommended minimum h9). The bearings are designed for press-fit into a housing machined to a H7 tolerance. After being assembled into a nominal size housing, in standard cases the inner diameter automatically adjusts to the F10 tolerances. For particular dimensions the tolerance differs depending on the wall thickness (please see product range table). In relation to the installation tolerance, the inner diameter changes with the absorption of humidity.
